## How to build conditional "add unit" or "remove unit" via the general schedule.

In order to do this, we can take the file *schedule.xls*, and looking at the file if we would like to add a new factory we should look at the first column, which correspond to the *Macros* "factories" and in the second column we should specify how we want to modify the factories.

- if we decide to add a we can set a -*n* in the second column and then in the 3rd coulmn the *f* unction "addAFactory".
- 2. if we would like to remove one we could use the same procedure, but calling then the *f* unction "removeitself".
- if we want to create a factory with a certain probability we can use the same procedure of the "addAFactory" but instead to use n, in the second column, we insert a value 0<q<1 with no sign before it.
